

Testimonial - Grain storage facility

Specialist Installations Division

Grain storage and the environment go hand in hand at the extensive grain storage facility at Hemsby, nr Great Yarmouth, for G W Daniels.

The facility boasts a central 3000 tonne grain store stored to 4.2m with grain stirrers, lean to's capable of housing additional grain storage with low volume ventilation, a chemical store, workshop and sprayer shed.

The site also benefits from a new site entrance, weighbridge and portacabin office space and fuel storage facilities.

The Specialist Installations Division won the contract on competitive tender with a key feature of the tender being the ability to ensure a central point of control of the project with sister company Balsham Buildings completing works for the facilities.

SID worked closely with David Ellis from Acorus Rural Property Services, who managed the project.

Jeremy Nunn explains: "As well as cutting edge technology being utilised in the new buildings a key feature is the environmental aspect of the works, with a

rainwater harvesting system in place for sprayer filling, using special filters and an above ground storage system, and the inclusion of a bio-bed for water treatment on site. The building was designed for the installation of Solar PV.

"Environmental impact and consciousness is a key feature of modern designs; whilst minimising the impact on the environment these design aspects can have a positive impact on the bottom line of a business in the long term." - Jeremy.

The environmentally sensitive building for G W Daniels
